

.NET & JS/TS Developer
Alexander Sergeev
@lowernight

Lead Backend Engineer · System Architect · AI / Agentic Systems

About me

Hi, my name is Alexander, specialize on **web application** development and **microservices** environment.

For the last years focused on **AI-assisted & agentic engineering**: building agent orchestration on top of LLMs and bringing agent-oriented development to long-lived production systems.

Location: Russia

Telephone: +7(902)*****80 (Please, contact me in mail or telegram)

Email: lowernight@yahoo.com

Skills

Languages: C#, JavaScript/TypeScript, C++ (11, 20), Rust

AI & Agents: LLM orchestration, Claude, agentic workflows, multi-agent systems, MCP, RAG, prompt engineering, self-verifying agent pipelines

Code Quality & Static Analysis: custom Roslyn analyzers, Roslyn, .editorconfig, analyzer rule sets, code style enforcement

Technologies & Frameworks: .NET Core 3/5/6/7/8, .NET Framework, .NET Standard 2.0/2.1, ASP.NET Core, ASP.NET MVC, Avalonia UI, WPF, Node.JS, Bun, React

Libraries: EF Core/6, Linq2DB, Dapper, Benchmark.NET, xUnit, Moq/AutoMoq, MassTransit, MiniProfiler

Tools: Jira, Confluence, TeamCity, BitBucket, GitLab, GitHub, Draw.io, Postman

Operating System: Windows, Linux (Ubuntu/Fedora/CentOS)

Messaging & Streaming: Kafka (native client; consumer groups, partition replication, retention log), RabbitMQ, MassTransit

Databases & Environment: Postgres, MongoDB, ClickHouse, Redis, Minio

Monitoring & Profiling: Prometheus, Grafana, VictoriaMetrics, Elasticsearch, Kibana, Logstash, Loki

Web/Application Servers: nginx, traefik, IIS, IIS Express, self-hosted

Orchestrators & Container Runtime: Kubernetes, Docker Swarm, Podman, Docker

Methodologies: SCRUM, Kanban, SOLID, Clean Code, ACID, TDD, DDD

Summary

Highly effective web application developer, with a large stack and experience
I specialize in product development and platform development. Excellent at
estimating time on task and handling complex situations

Can establish communication with any team and person, able to differentiate and abstract from personality

Excellent with architecture design tools and select good and fast solutions based on needs and time constraints

Designing and building agentic systems: in-house orchestration that turns Jira tasks into code with self-review loops, and bringing AI-assisted development into a production team

High bar for code quality: enforce style and architecture through custom Roslyn analyzers, `.editorconfig` and rule sets, so AI-generated code stays clean, consistent and review-ready

Work experience

2020 - 2022, Energosfera

Project Role - **Middle FullStack Developer**

About Company - Largest retail company in the north in Russia

About project/s - Internal CRM for management documents and transport logic

Team size - 1 Project, 1 Tech Lead, 1 Team Lead, 2 - Product Managers, 8 - Developers

Task performed:

Networking and reverse proxy configuration.

Development product features in legacy modules.

CI/CD customization and support for your projects.

Work with retail devices KKM, Terminal, Cash system.

Developing and updating internal desktop applications.

Introduction of new functions compliant with legislation.

Architectural planning and development of projects such as **Bonus system, Cash modules, Document Routing.**

Company stack:

C#, .NET Core, .NET Framework, Dapper, EFCore, JS/TS, React, Electron.JS, Docker, Prometheus/Grafana, Zabbix, PostgreSQL, Redis, RabbitMQ, Elasticsearch, Kibana

2022 - **For now**, Hybrid.ai

Project Role - **Lead Senior Backend Developer, System Architect**

About Company - Marketing company, ranked 3rd in the world. Provides a complete package of necessary for opening and advertising on sites

About project/s - CRM, DSP, SSP, Big Data statistic, more feature for marketing life, integration with popular solutions and advertising world supplier

Team size - 1 Project, 4 Team Lead, 1 - System Architect, 8 - Product Managers, 16 - Backend, 14 - Frontend

Task performed:

Designing an **in-house agentic orchestrator** (currently in testing): pulls tasks from **Jira**, generates and edits code with **self-verification** loops, and **estimates the dollar cost of a feature** before work begins.

Enabled **agent-oriented development** on a 7-year-old core monolith — product teams now extend it directly through **Claude Code**, while the engineering team owns the surrounding fleet of **20–30 microservices**.

Architected the product around **deep DDD with a plugin system**: clear domain boundaries and extension points that keep a long-lived monolith maintainable.

Designed and maintained the **internal shared libraries** consumed by all products and microservices — common abstractions, conventions and building blocks that standardize how every team builds across the platform.

Built a **notification service handling 50k rps** at the initial stage, with horizontal scaling headroom.

Introduced **AI-assisted development** (Claude → in-house `pi-coding`) into the team's day-to-day delivery.

Built **guardrails for agent-generated code**: custom **Roslyn analyzers**, strict `.editorconfig` and rule sets that constrain agents to a compliant, review-ready code style — keeping architecture and quality bar fully owned by me.

Built an internal **job orchestration & monitoring system**: cron-scheduled internal jobs with a web UI and **Keycloak**-based auth.

Owned **product telemetry** and quality practices — evaluating, testing and rolling out observability tooling for the team.

Introduced an **exception inheritance hierarchy** splitting **business vs technical** errors, so support captures maximum diagnostics per issue and bugs reach developers far faster.

Built custom observability **dashboards in Kibana and Grafana**, and stood up

VictoriaMetrics and **Elastic** stacks for testing and diagnostics.

Planning the architecture of highly loaded solutions.

Development and implementation of new product features.

Selecting and advocating technologies for new products.

Direct involvement in decisions important for the product.

Development of features for processing large amounts of data.

Providing the product to the customer, developing presentations.

Conducting a code review highlighting common code style and approaches.

Architecture planning for third-party projects, preparation of MVP solution.

Optimization of work with the database, ensuring fault tolerance of existing tools.

Manage a team of 4 refactoring legacy modules and extracting satellite microservices around the core monolith.

Support and fix legacy code with optimization of existing solutions in a constrained environment.

Setting up a ready-made production and development environment on **kubernetes** for new projects with **monitoring**

Company stack:

C#, .NET Core, .NET Framework, Dapper, EFCore, Linq2Db, MassTransit, Kafka, Redis, RabbitMQ, JS/TS, xUnit, MSUnit, Benchmark.NET, React, Docker, Kubernetes, Nginx, IIS, JMeter, Ansible, Loki, Proxmox, Amazon S3, Minio, Prometheus/Grafana, VictoriaMetrics, Zabbix, PostgreSQL, MongoDB, Elasticsearch, Kibana, Keycloak, Claude / LLM, MCP, agentic orchestration, Bun, TypeScript

Projects

[pi-soly](#) — *open source* — my own opinionated, agent-oriented project-management framework (companion to a coding agent). Built in TypeScript on the Bun runtime, shipped as an npm package.

Workflow engine with `/plan`, `/execute`, `/resume`, `/inspect` slash commands and a GSD-inspired planning cycle with persistent, git-friendly Markdown state.

Multi-agent **rotor switcher** to hot-swap between specialized agents (worker, oracle, scout, ...), live in-turn task list, and a tabbed multi-question picker tool.

Zero-config install — bundles planning, task management and agent switching into a single dependency.

[notifiwy](#) — *open source* — my own **.NET library**: a distributed handler & pipeline for **notifications**, built for event-driven architectures with a fluent builder API. Published under my org [dot-stbl](#).

Composable processing pipeline (input → connector → conditions → mapper → exporter), fully async with **DI** integration.

Pluggable transport providers (**Kafka** / **MassTransit**), built-in metrics and **OpenTelemetry** diagnostics.

Real-time crypto analytics & trading platform — *private, self-hosted* — a personal platform that ingests and processes **~150k events/sec from 18 exchanges** and exposes unified market analysis and automated trading.

High-throughput event pipeline with low-latency aggregation across heterogeneous exchange feeds.

Source kept in a self-hosted Git; not public — details and walkthrough available on request.

Self-hosted home ecosystem — *private* — a suite of personal services and automation I design, build and run on my own infrastructure.

Education

Nefteugansk's Technology College

Faculty - Production
